

Give a stablecoin a job.

An autonomous treasury agent that puts idle stablecoins to work in tokenized real-world-asset yield on X Layer.

PROBLEM

Stablecoins sit idle. Earning on them safely is hard.

- Hundreds of billions in stablecoins earn **nothing** by default.
- Real-world-asset yield exists on-chain, but capturing it safely means watching peg, liquidity, concentration and exit risk **continuously**.
- Yield bots sort by APY and stop there, ignoring the risks that actually lose money.

SOLUTION

An agent that reasons, then acts, within on-chain limits.

Deposit a stablecoin. Aumo allocates it across tokenized real-world-asset and lending yield on X Layer, inside guardrails enforced on-chain, and records a verifiable receipt for every move.

Reasons

Scores real risk, not just APY.

Non-custodial

Guardrails live on-chain, not in the agent.

Provable

A signed receipt per decision.

HOW IT WORKS

Judgement, enforced on-chain.

Deposits sit in an ERC-4626 pool. The agent can allocate capital but can never withdraw it to itself. The venue allowlist, position caps and per-epoch budgets are enforced on-chain, so a fully compromised agent key still cannot drain the pool.

WHY NOW

The rails Aumo needs are the ones OKX is laying.

- OKX Ventures frames 2026 as the **Kinetic Finance** era: capital judged by how it moves and earns, participants shifting from people to agents, DeFi becoming the execution layer agents optimize on.
- X Layer is building RWA hard: a \$5M RWA liquidity-incentive program, tokenized equities on-chain, and OKX Ventures' own investment in an RWA-backed stablecoin.
- Aumo is the first audited, guardrailed agent on those rails, and it compounds as X Layer's RWA market deepens.

LIVE TODAY

Proven on mainnet, not a prototype.

This month the agent enforced a single-issuer diversification limit **on its own**: it trimmed an over-concentrated position and redeployed the capital into a different underlying. Two on-chain transactions, each recorded with its full reasoning.

Live

X Layer mainnet, since Aug 2026

4

Venue adapters, fork-verified

85

Automated tests

3-pass

Adversarial security audit

Asset-management economics.

Revenue scales directly with total value locked and stays aligned with depositors. Aumo is paid when they earn. No token required for the business to work.

1%

Annual management fee on assets under management.

10%

Performance fee on the yield Aumo produces.

THE ASK

\$250,000

Early-stage. Strategic investment or X Layer ecosystem support. Roughly twelve months of runway.

External security audit	\$60,000
Liquidity bootstrap and incentives	\$90,000
Founder full-time and first hire	\$80,000
Infrastructure and operations	\$20,000
Total	\$250,000

12-MONTH MILESTONES

- External audit published
- TVL to a first threshold (\$2M target)
- Two new RWA venues integrated
- First distribution partner (OKX Wallet)
- First fee revenue
