

The autonomous treasury for stablecoins.

An AI agent that puts idle stablecoins to work on X Layer, inside limits written into the contract. Live on mainnet.

The opportunity

Hundreds of billions in stablecoins sit idle, earning nothing.

People hold digital dollars for safety and speed, then leave them parked. Earning a real return means picking protocols, watching risk around the clock and getting out before things break. The ones who chase the highest rate are usually the ones who get burned. There is no safe, hands-off way to earn on stablecoins. That is the gap.

What we built

Deposit once. The agent does the rest.

Hands-off

Deposit and walk away. The agent scores venues, moves funds and rebalances around the clock.

Safe by design

Funds only move between allowlisted venues and back, never to an outside address.

Always yours

Withdraw from the stablecoin pool at any time. The agent never holds custody.

The product today

One agent, four ways to put money to work.

Stablecoin yield

USDT0 across Aave, a Treasury-backed dollar, Pendle and Uniswap fees.

Tokenized stocks

NVIDIA, Apple, Microsoft and Meta, each in its own pool.

Diversified basket

All four at equal weight, rebalanced when they drift.

Tokenized gold

PAXGy, gold whose entitlement grows over time.

Why it wins

Most yield bots chase numbers. Aumo manages risk.

It reads the trend

Not just today's rate but its direction. A venue quietly getting riskier is flagged before it is obvious.

It stress-tests first

Every move is simulated against a shock, and anything that could trap funds is refused.

It second-guesses itself

A built-in critic reviews every plan and can veto it. The AI layer can only make a plan more cautious.

The proof

When a high-yield venue broke, Aumo was already out.

A 30-cycle backtest against a strategy that chases the highest rate, on the same market, as a venue quietly deteriorates and then breaks.

+27%

more value at the end

0%

drawdown, against 21% for the chaser

\$0

exposed when the venue broke

On stocks, diversification is what held: an equal-weight basket cut the worst drawdown from about 43% to about 32% over five years. Backtests, not promises.

Built to be trusted

Control lives in the contract, not the agent.

Caps in the contract

Per-move, per-venue and total limits are enforced on-chain. Not the agent, and not us, can move funds past them.

Reviewed and hardened

Security-reviewed with no critical or high issues, machine-checked across 128,000 simulated scenarios. The equity pools were self-audited and redeployed hardened before they opened.

Every move provable

Each decision is recorded with a plain-language reason, bound to the policy that allowed it.

Why now

Real yield is on-chain. Almost no one can reach it safely.

Stablecoins went mainstream

Digital dollars are how millions now hold value on-chain.

Real-world assets are the growth story

Treasury-backed dollars, tokenized stocks and gold are arriving on-chain fast.

No safe autopilot exists

Reaching that yield still takes expertise and constant attention.
Aumo removes both.

Where we are

Live, running, and shipping every week.

Live

On X Layer mainnet since Aug 13, 2026

4,700+

Agent decisions recorded on-chain

7

Pools: stablecoin, four stocks, a basket, gold

140+

Automated contract tests passing

The full product is built and live: the pools, the AI agent, cross-chain deposits, the dashboard, Ask Aumo, and the transparency layer. The agent runs around the clock.

The vision

The autopilot for on-chain capital.

The engine that runs a person's stablecoins can run a treasury for a DAO, a company or a protocol.

Individuals

Earn on stablecoins with zero effort.

DAOs and treasuries

Put an idle treasury to work, transparently.

Protocols

Composable, provable yield as a building block.

The safest way to make your stablecoins work.
